

Wood burning stoves
with very simple use
and clean combustion

A fire should be an experience

Aduro unites handsome design, user friendliness, quality and function in a comprehensive product range. With Aduro stoves we have created the conditions for many cosy hours in both modern and classic homes. The wood burning stoves were designed by the Danish architects Torben Madsen and Casper Storm, whose primary task was to create modern and environmentally friendly wood burning stoves at attractive prices. They have been designed with simple and stylish lines, concealed hinges and without visible welds. The control is discreetly hidden so as not to disturb the experience of a living fire. All the stoves are built with an effective air-wash system that prevents soot from collecting on the glass pane.

The stoves are convection stoves, thus heat is distributed via air circulation. This creates a uniform and comfortable temperature in the room and, at the same time, means that it is possible to place the stove closer to inflammable materials. In the summary at the back you will find the distance requirements that must be maintained upon installing.

Aduro and the environment

Aduro wood burning stoves have the most modern and advanced combustion principles and have been tested in collaboration with the Danish Technological Institute. To emphasize our contribution to environmentally correct burning and production, all our stoves carry the Nordic Swan Eco-label. This is a guarantee that our products are amongst the best on the market. Particle emission lies below the Swan mark's restrictive requirements and our stoves discharge less than half of the number of particles required by the Scandinavian standards. A Swan marked wood burning stove from Aduro makes it simple to care for yourself, your family and the environment. Simultaneously we have developed a unique automatic control device, Aduro-tronic, which makes it simple to achieve optimum combustion every time without difficulty.

You can light your Aduro wood burning stove with a clear conscience because heating with wood is CO₂-neutral. Wood absorbs just as much CO₂ from the atmosphere whilst the trees are growing as the wood releases when it is burnt. With a wood burning stove you are contributing positively to CO₂-levels and global climate change if you burn correctly. At www.aduro.dk you can download a film on how to burn correctly.

Safety

Aduro wood burning stoves are solidly constructed and regularly undergo an impartial, external quality inspection from Danish Ecolabelling and Norway's Sintef. In addition quality assurance has been introduced in the production. This ensures your safety and guarantees quality products. We provide a guarantee for up to 5 years for our Aduro wood burning stoves.

Aduro I with drawer

A modern convection wood burning stove that is characterized by its clean lines and timeless appearance. The round design and curved glass of this wood burning stove maximise the appearance of the flames from all corners of the room. Aduro I can also be obtained clad in Finnish soapstone on the sides and the top. Soapstone is a unique natural product, which has the property of being able to absorb heat and release it over a longer period.

Aduro-tronic automatic control device

Aduro's patent pending automatic control device Aduro-tronic is a simple and handy feature, which automatically regulates combustion air for you and ensures that the primary air is set at the correct pace. You just need to place dry wood in the stove and activate the automatic device. It will manage the rest. The automatic control device has a wide range of advantages for both you and the environment – quite simply it makes a difference.

Simple service/increased comfort

The automatic control device does the work for you, so you don't need to regulate the combustion air several times within the first minutes after each firing. Just lie back on the sofa and watch the flames play.

Improved fuel economy and combustion

Incorrect air flow results in significantly lower fuel economy, since the wood burning stove will consume a greater amount of wood. Tests have shown that a wood burning stove that burns with an incorrectly adjusted damper burns approx. 70 % more wood than a wood burning stove that is equipped with Aduro-tronic. In addition to lowering wood costs, one of the greatest qualities of Aduro-tronic is that it ensures ideal combustion and a minimum discharge of particles.

The automatic control device functions mechanically without the use of electricity. Aduro 1, 2, 3 and 4 are suitable for the automatic control device, whilst Aduro 6 is equipped with it.

Do you dream
of a cosy fireplace?

Aduro 5 is a new and elegant fireplace insert to create cosy and environmentally correct heating. It is formed in a stylish, minimalist design with a completely smooth front and a large glass door that gives a free view of the dancing flames. But Aduro 5 is more than just a handsome design. It is a high-tech fireplace insert developed with the most modern and advanced combustion principles.

The fireplace insert was designed by the Danish architect Casper Storm, who has created a piece of elegant and simple furniture for the modern home.

Individual fireplace solutions

Aduro 5 can be adapted to meet your needs and desires. It is suitable for both existing and newly constructed fireplace environments. For example, if you have an open fireplace, Aduro 5 will change this into an environmentally correct and efficient heat source. Another option is to integrate the insert in connection with renovation, extension or a new construction. Only you set its creative limits. Regardless of what you choose, Aduro 5 will be beautiful furniture for your home.

“Do-It-Yourself” with aerated concrete

The fireplace environment can also be constructed in environmentally friendly aerated concrete, which is a very flexible material with exciting application potentials. Aerated concrete is an inorganic, artificial material, but it withstands heat and is therefore well suited to a fireplace environment. It is easy to form and handle; in fact it only requires a choice of tool to make your dream home into reality. Find further help and inspiration at your local DIY store.

Aduro 3 with drawer

Aduro 3 is a modern wood burning stove with an elegant front in cast iron, which creates the potential for handsome curves. The design is simple and timeless without superfluous details. Cast iron is a solid material with a beautiful finish. The combustion results of this Swan marked wood burning stove are the best. Aduro 3 is recommended by the Danish "TÆNK" consumers' magazine.

ADURO 6SK

This functional wood burning stove is incredibly suited to heating many square metres. The large wood chamber makes it possible to burn logs up to 41 cm long. Aduro 6SK is formed in a simple design with soft curves and elegant details. The stove is clad in soapstone on the sides and the top and has a cast iron door. Aduro 6 is also available in a version with drawer, top and door in cast iron (see front page). Both versions are equipped with the Aduro-tronic automatic control device as standard.
